

ABSTRACT

[0036] The details of an apparatus and method for responding to a cell or URA update confirm message with a correct C-RNTI information element are disclosed herein. When a UE receives a Cell or URA Update Confirm message from a UTRAN, it determines whether a response is required prior to entering the state specified in the message. If a response is required it uses the new C-RNTI element to send the response, if this element is available.
